OPEN SOURCE RELEASE

ACADEMIC SYSTEMS

Stop making ugly research slides.

> How I built an autonomous research-to-PPT engine that cites real peer-reviewed science.

Most AI tools spit out generic marketing decks.

Commercial slide generators produce fluffy bullet points and hallucinated statistics.

> They can't verify an academic paper, format a biochemical pathway, or cite a single genuine DOI.

My 3-layer open architecture

1. **DeerFlow:** Deep literature discovery and multi-agent evidence mining.
2. **ECC Layer:** Strict scientific verification and citation DOI auditing.
3. **PPT Master:** 100% native DrawingML vector layout compiler.

Zero hallucinated references

The engine queries **Europe PMC** and **Crossref** directly.

> Every single slide gets an audited footer capsule with full journal citation and active DOI link.

100% native vector shapes

We don't do flat raster image slop that breaks when resized.

> Every flowchart, card, and table imports into **PowerPoint** and **Canva Pro** as crisp, fully editable vector elements.

LOCAL HARDWARE

Built for 8GB RAM laptops

You don't need a thousand-dollar cloud cluster or heavy local weights.

> Runs locally on an AMD Ryzen laptop with sequential slide compilation and zero paid API traps.

Royal Oxford keynote styling

Luminous slate-white and deep navy palette with **100% Times New Roman**.

> Modeled after Nature publications and Harvard Grand Rounds to command immediate respect from professors.

Autonomous Academic Deck Stack

- ✓ Fast automated Europe PMC queries
- ✓ Verified peer-reviewed DOIs
- ✓ 100% editable DrawingML vector cards
- ✓ Canva Pro plus PowerPoint compatible
- ✓ Runs locally on my 8GB RAM AMD Ryzen setup

Grab the Open-Source Code

Star the repository and download the full 17-slide demo deck, raw vector shapes, and speaker notes:
